

Cacoo is a basic free wireframing design website. It seems easy to use, and has all the basic built in tools one would need to wireframe. Cacoo also has basic sharing tools so you can work on a design with others. It launches in a separate tab and has great “pre-made” layouts you can start off with. Cacoo also allows you to export your design in multiple formats, such as PNG, JPG, and PDF.

Gliffy is more of a basic layout tool, not necessarily made for website wireframing. It has a nice layout of drag and drop shapes onto a plain, which makes basic designs very easy to create. It also has a collaborate feature, and can be exported as PNGs and JPGs, but no PDF.
